

Product Management

Backend Development Challenge By 6sense Technologies

I have completed the tasks you provided:

1. **Product Creation:** Added functionality to create products.
2. **Product Code Generation:** Generated product codes using the given pattern.
3. **Associate Products with Categories:** Linked products to their respective categories.
4. **Update Product Information:** Added the ability to update product details.
5. **Filter Products:** Implemented three filters for product searches.
6. **Database Design:** Added a link to the database design in the README.md

Extra Features:

1. **Delete Product:** Added a function to delete products.
2. **Discount Price:** Created a new entity for discount prices, so customers can see the original price and the discount difference.

For the backend, I used **NestJS** and **PostgreSQL**. I'm not very familiar with MongoDB yet, but I'm ready to learn and use it if required. I have also implemented DTOs and validations to ensure data integrity.
